

# 1 Appendix B. Screenline Volumes

## Work in Progress – Not for Public Distribution

This appendix contains screenline volumes for the individual facilities that make up the larger screenlines. These aggregated screenlines are referenced in sections 3.3.2 and 4.3.2 of the Transportation Technical Report (TTR). Screenline figures (Figure 3-4 and 3-5 in the TTR) are provided below to show where each screenline is located in both Vancouver and Portland.

It is important to keep in mind that the volumes presented in these tables are from a regional travel demand model that is not calibrated to individual facilities and does not reflect post-processing. The regional travel demand model assignments use an equilibrium process whereby the resulting volumes reflect a condition where no traveler can improve their travel time or cost by switching paths. Traffic loads onto the network via zone connectors that represent all traffic coming in and out of an area and does not reflect exact loading to and from the network via local connector facilities or driveways. Differences in assignments may simply be the result of the equilibrium process and how trips enter and exit the network. The assignments do not reflect real-world traffic conditions and should be used to gauge general changes between alternatives. For more specific traffic differences at individual facilities or intersections it is more appropriate to utilize post-processed information that is available in Section 4.6 of the TTR.

Figure 3-5. Screenline Locations – Portland
